About

EthnoGuessr is a geography guessing game that challenges you to identify the origin of ethnic groups, people, countries, and dog breeds from visual clues. The web app turns each round into a map-based test of observation, with daily modes, a leaderboard, and a learn-as-you-go result screen. It is built for quick play in the browser and includes a Genomes mode where users can upload their own results to become guessable.

What is EthnoGuessr

where it belongs, and drop a marker on the map to score points. It is designed as a daily challenge, so the experience feels like a repeatable puzzle rather than a one-time quiz.

The app currently presents several modes, including Classic, Genomes, Countries, and DoggoGuessr. Each mode uses the same basic guessing loop, but the subject changes from ethnic group facial averages to real people's AncestryDNA results, national-origin composites, or dog breeds. That makes EthnoGuessr less like a trivia page and more like a family of related geography guessing game variants.

The site also includes a leaderboard, updates, support links, and a sign-up flow. From the harvested site text, it is clearly web-based and built around daily play. The app's own copy says the goal is to test your knowledge of human diversity, then learn the real answer after each round.

Key features

EthnoGuessr combines a few distinct features inside one geography guessing game:

- **Daily challenge structure:** several modes are described as "play daily," which suggests a repeatable challenge format rather than endless free play.
- **Classic mode:** shows facial averages of ethnic groups and asks you to guess their geographic origins on a map.
- **Genomes mode:** uses real photos and asks players to guess AncestryDNA results, then ties that to the map.
- **Countries mode:** switches the subject to facial composites from different countries around the world.
- **DoggoGuessr:** a lighter variant that uses dog breeds instead of people.
- **Leaderboard:** gives players a way to compare performance.
- **Upload flow for Genomes mode:** the site says users can submit AncestryDNA results and photos to appear in Genomes mode.
- **Learning feedback:** after guessing, the game reveals the real answer and includes history and origin context.

Because EthnoGuessr is a geography guessing game with multiple modes, the same player can use it for casual practice, competitive score chasing, or curiosity-driven

How to use it

1. Open the site in your browser and choose a mode from the home screen.
2. Study the image or facial composite shown for that round.
3. Place your guess on the map where you think the origin belongs.
4. Wait for the score, then review the correct answer.
5. Use the explanation to learn more about the group’s history and origins.

In the Classic geography guessing game mode, the emphasis is on facial averages. In Genomes mode, the app asks you to infer ancestry from real photos and AncestryDNA results. In Countries mode, you make a country-level origin guess. DoggoGuessr follows the same interaction model but swaps in dog breeds.

If you want your own data to appear in Genomes mode, the site provides an Upload Results path and prompts you to create an account. That makes the app more participatory than a standard quiz page, since the geography guessing game can include user-submitted material.

Who it is for

EthnoGuessr is a fit for people who like:

- browser games that can be played in short sessions
- map-based guessing game mechanics
- quizzes about geography, human diversity, or ancestry
- competition through leaderboards
- low-friction daily challenges

It may also appeal to players who enjoy variants of GeoGuessr-style mechanics but want a different subject focus. The geography guessing game format is broad enough here to serve both casual users and players who want to compare scores over time. The Genomes mode adds an extra angle for people interested in ancestry testing, while DoggoGuessr is a more playful side mode.

What to know before you use it

EthnoGuessr is a geography guessing game, but it is not a scientific identification tool. The site asks players to infer origins from faces, composites, and ancestry results, so the game depends on approximation, interpretation, and scoring rules rather than exact verification.

A few practical caveats matter:

- The app's accuracy is limited by the quality of the image, the completeness of the dataset, and the player's own knowledge.
- The "origin" being guessed is part of a game mechanic, so it should not be treated as a definitive statement about a person or group.
- For real identity, ancestry, or demographic questions, official records, DNA providers, or qualified research sources are more appropriate than a geography guessing game.
- Genomes mode includes an upload pathway, but the site text does not explain moderation, review, or eligibility details, so those terms are unknown from the source.

The strongest use case for EthnoGuessr is learning through repeated play. As a geography guessing game, it works best when you treat the result screen as feedback and the leaderboard as a score challenge, not as a factual authority. If you want a browser-based geography guessing game with multiple daily modes, EthnoGuessr gives you a clear loop: guess, score, learn, and try again.
